CHECKLIST

According to the PDF file, input files, and output files provided to us for the assignment, my program is functioning correctly. My program is able to catch all the errors present in the input and output files. Additionally, the error situations that should occur but are not visible in the files provided to us are listed below, and my program is able to catch these error situations as well. If any other erroneous situations arise, the program can terminate its execution.

1- If an undefined smart device type is given after the "Add" command, the program displays the message "ERROR: Erroneous command!" to the user and continues to read the other commands in the input file.

2- If more or fewer parameters than required are given for any command, the program displays the message "ERROR: Erroneous command!" to the user and continues to read the other commands in the input file.

NOTE: When the program is compiled with the "javac Main.java" command, some files with the .java extension are not compiled. Please use the "javac *.java" command to compile the program.
